

Stimulation for employees: of each a painted portait

Art at Work

To excite and stimulate creativity of employees. That is what is most certainly happening at Anatech, developer and manufacturer of laboratory instruments. For example: in the company one will find many works of art, so each worker will flourish as fertile as possible in that artistic environment.

By the way, it was not the current owner Archi Leenaers, but the preceding one, that started buying art in order to exhibit it all over the business building. 'When I took over Anatech, he explicitly asked me to preserve the art collection. A request I gladly granted, because I also have lots of affinity with art. Moreover I fully agree with him: art definitely has a positive result on the people that are confronted workaday with it', Leenaers enthusiastically clarifies.

"We-feeling"

At Anatech the variety in works of art is quite large. The garden reveals statues in various styles, executed in various kind of stones, and surrounded by several different fruit trees and plants. Inside the building the statues, paintings and photos are widely spread. The total collection counts about one hundred items. Remarkable are the painted portraits of all employees in the entrance hall of the building. Everyone having a final contract of employment is being painted by the Spanish painter Francesco Pistolessi. By doing so, I want to emphasize that all those hanging there belong to the Anatech family. Also

Leenaers released a wall in the canteen to exhibit impressive personal photos, made by Anatech's employees. It can be seen from the varied collage on the wall that the workers like to contribute to it. Amongst the current employees of Anatech are some that play a music instrument or sing. Also that aspect can be noted in this company: in the canteen a piano is located, that is used quite frequently.

Computer technics

An employee was asked by the director to photograph all the instruments that have been developed by Anatech since its establishment. All these 30 instruments will be portrayed, using its application as a background. To judge from the first photos, this will turn into a very special photo collection.

"Our specific knowledge is in embedded computer technics. We come up with smart solutions that are reliable, simple to operate and with an excellent price to performance ratio. When developing new instruments, the slogan is not 'Adapt to solve' but 'Explore the limitations'. By doing so, better overall solutions are found. And that is where the inventiveness of our people is excited. And for that, I like to create the optimal environment where this is possible and enough space is left for new ideas."

The laboratory instruments of Anatech are used in various markets for quality control (QC), product development and fundamental research. Anatech employs 25 people.
